(54) Title: METHOD FOR HIGH-THROUGHPUT SELECTION OF INTERACTING MOLECULES

(57) Abstract: The present invention relates to a method for the selection of at least one member of a number of specifically inter-
acting molecules, said method being carried out in (a) container(s), preferably representing an arrayed form, e.g. in (a) microtiter
plate(s), using an automated device comprising a magnetic particle processor. In another embodiment, the present invention relates to
a method for the production of a pharmaceutical composition comprising the steps of the method of the present invention and further
the step of formulating at least one of said specifically interacting molecules selected and/or characterized by the above method or a
functionally and/or structurally equivalent derivative thereof in a pharmaceutically acceptable form.
